SETTINGS

- Application Information
- Application Definition
- ▶ Registries
- ▶ Automatic Registries

A document type is a combination of schemas (which metadata are handled), a life cycle (states the document can go through), facets (capabilities like versioning, publishing, containing other documents), etc. It is one of the first features you want to configure using Studio. Some projects require many document types.

Name

Create Document Type

Feature ID MyAsset

Extends

- Nothing
- File
- Folder

By extending a document type, you will inherit some of its configuration (metadata, facets..). If you select "Nothing", you will only have the "Dublin Core" metadata. Select "File" if the main goal of your document type is to hold a binary, and "Folder" if you want to create a custom Folder.
